Pools

Pools are trusts, bound by context or theme, that turn verified resilience and regeneration into an investable primitive for resilience dividends and benefit sharing.

Pools Enable:

- Municipalities to campaign and crowd source resilience efforts.
- Rivers and forests to hold funds and compensate for care
- Communities and insurers to finance wildfire mitigation
- NGOs to track SDG accounting
- Bounties for civic and bioregional care
- Sovereign incentive structures for stewardship
- Co-governance on the indices we use to measure planetary flourishing

Catastrophic loss is growing unchecked. Today's finance only funds the aftermath.

$318B
Global economic losses from natural catastrophes in 2024

6 yrs
in a row of insured catastrophe losses above **$100B** globally

1.9%
of $158.9B in US disaster funding (2020–24) went to **mitigation**

39M
US properties at **high risk** of flood, wildfire and hurricane wind

A trillion-dollar shift from recovery to prevention is underway.

Capturing just 1% is $13B a year.

$1.3T
a year of projected **adaptation and resilience** demand by 2030

$65B
tracked for adaptation in 2023, about **3%** of $1.9T in climate finance

6×
saved in future disaster costs for every **$1** spent on mitigation

HYPOTHESIS

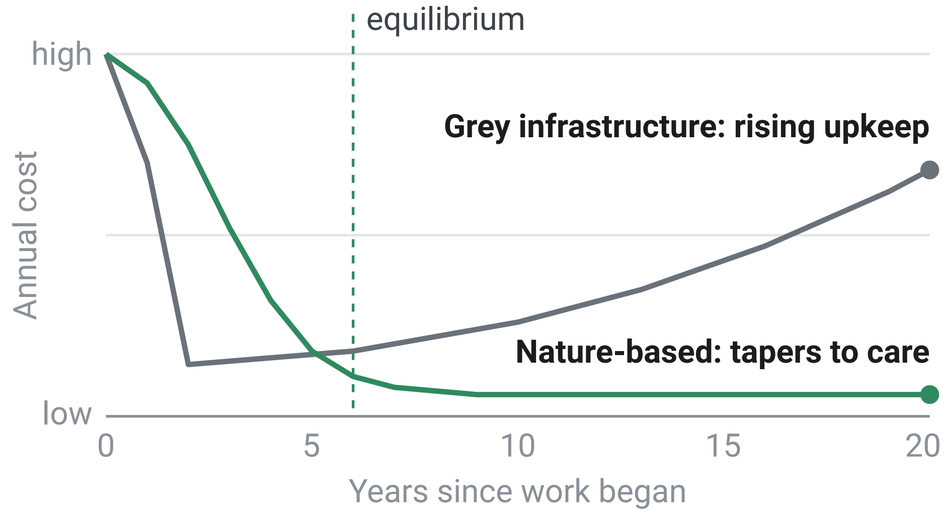

Regeneration and resilience prevent future loss. Prevention creates savings that can be verified. Verified savings can be shared. **Shared savings can fund future rounds of regeneration and resilience.**

Sources: Swiss Re 2024 via Carlyle × Marsh 2026; Forest Trends 2026; Temasek × BCG 2025 (upper estimate); CPI, Global Landscape of Climate Finance 2025; National Institute of Building Sciences, Natural Hazard Mitigation Saves, 2019; First Street 2023.

The nature-based advantage to mitigation

The maintenance curve

Today's finance is built for resilience infrastructure that needs constant upkeep. **Nature-based infrastructure sustains itself.**

Opportunity - Targeted Equilibrium

> Fund the push to equilibrium once. Get protection for **a fraction of grey's lifetime cost.**

Cost curve illustrative, after Forest Trends, Living with Fire and Water, 2026, Fig. 1.

Many stakeholders with common challenges

Communities, public sector, risk underwriters, real asset managers, etc all need robust mechanisms to prevent loss.

Neighbors
minimize collective risk · mutual risk transfer

Businesses
local · interruptions · supply chain

Risk Capital
insurers · reinsurers · catastrophe bonds

Public Budgets
municipalities · utilities · disaster agencies

Philanthropy
foundations · donor-advised funds

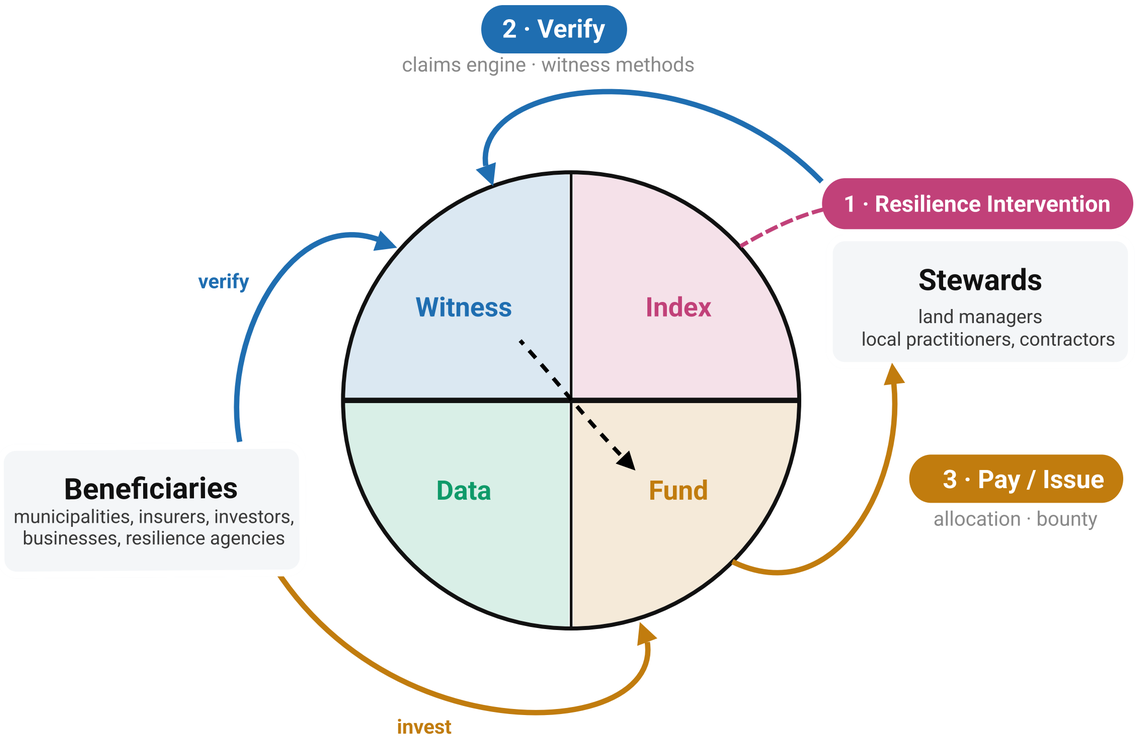

Impact Investment
concessionary capital · resilience funds

Opportunity - Aligned Urgency

> Many sectors are motivated to develop solutions across different sides of the financing gap. The candidate stewards, investors, and beneficiaries are clear

Pools - A trust of data and funds, governed by a verified index.

Pools organize capital and interventions around a bioregion, a risk profile, a municipality, a stewardship protocol, an SDG etc.

The index — defines what counts

Q1 · Index
the terms: which actions and outcomes qualify. and the rules that release funds or certs

Q2 · Witness
who and what must agree before a claim is considered valid. The verification requirements.

The trust — holds and allocates value

Q3 · Data
the record of claims, evidence and pool state

Q4 · Fund
the capital, cert issuer

---

1 **Intervention**
stewards do the work: dam analogues, fuel clearing, swales, debris removal

2 **Verify**
the claims engine and witness methods test that work against the index

3 **Issue**
the fund releases allocation, compensation, or impact certificates to stewards if witness is met

River Computer's claims engine and witness methods validate claims against the index, enabling payments, certificates and other institutional actions.

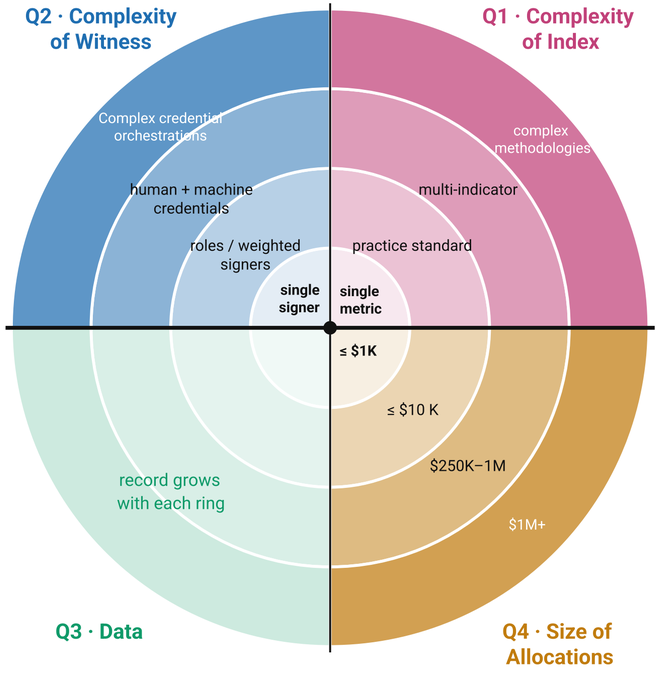

Balancing the complexity of index and witness to the scope of capital allocation

Designing a Pool means matching the complexity of each part of the mechanism to the others.

- **Incremental** Test the approach with smaller allocations for more simple indices and witness methods. Increase the complexity of the system incrementally.
- **In parity.** The modular design of pools allows more effective design, decision making, and governance over their composition. Its not a black box.
- **Govern the Index.** What we choose to measure, and how we define resilience or regeneration according to place or theme can be bespoke or borrowed.

Live today in Waka: project + user identities, anchors for evidence graphs on sovereign storage, witness methods built on verifiable credentials to control Hypercert Issuance

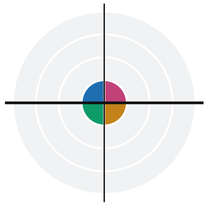

Built in this raise: multi-witness policies and index-gated payouts using BAAS and/or stablecoin rails. Registry of index and witness methods for reusable pool design.

Ring settings and dollar bands are illustrative.

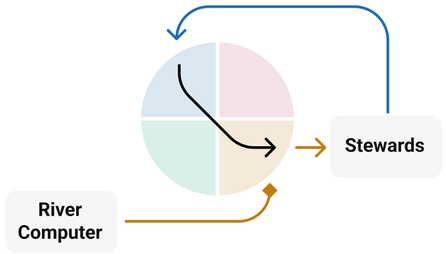

Each pilot is scoped so its index, its witnesses and its capital stay in parity — and so a pool that underperforms still publishes what it learned.

Validating the Hypothesis across 4 Pools

POOL	Plastic Pool	Fire Mitigation Pool	Swale Pool	Watershed Ecological Institution
	Verified removal and processing of plastic by weight, with chain of custody from collection to end state.	Parcel-level ember-zone treatment across a contiguous block, scored as one landscape	Paid construction of swales and infiltration features across municipal and private land in one catchment.	A river reach holds its own fund. Stewardship of the reach is rewarded against a hydrological index
PARITY				
INDEX	**Verified kg recovered** • collection weight	**Contiguous treated parcels** • 5-ft ember zone cleared • brush clearance • ladder fuel pruning	**Stormwater infiltrated** • rain garden construction • infiltration rate metrics • native planting	**Catchment + Reconnection** • beaver dam analogue installed • stream network reconnection • riparian replanting / invasive removal
CAPITAL / CYCLE	**<$500**	**<$1K**	**<$10K**	**<$10K**
POSSIBLE LOCATION	Coastal collection site	Uninsurable HOA in fire prone territory	Municipal stormwater district	Single reach, Western US
CANDIDATE BENEFICIARIES	Consumer brands · Tourism Industry · Municipalities	Insurers and reinsurers · residents · county · utility	Stormwater utility · city ·	State Agency on Green Infrastructure · irrigation districts ·
WITNESS	Weigh-station receipt · geotagged photo · processor credential	Peer credential · Inspector Credential · aerial imagery	As-built survey · peer validation · infiltration test · rainfall telemetry	Stream gauge · satellite NDVI · field survey

! Validation sites and collaborations are not final

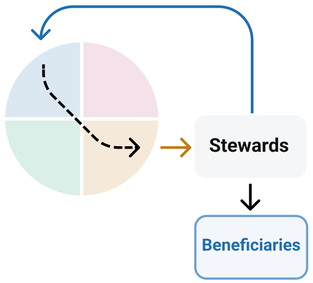

18 months, three milestones, each earning the next.

Seed and prove index, witness, and payment plumbing

RC seeds one pool of each type. Work is verified using witness methods against the index, and payment is allocated to stewards.

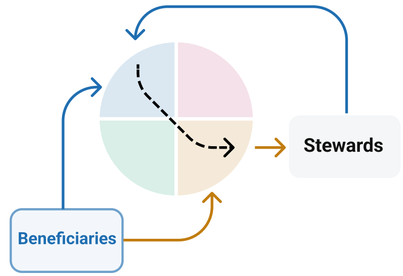

Milestone: An index and witness method defined. Payment plumbing for “proof of index” tested.

Identify beneficiaries per index.

Model beneficiaries per pool
Identify and record avoided loss savings per beneficiaries due to interventions from pool.

Milestone: Identify beneficiaries and records of avoided loss.

Match and refill

Formalize matching funds for benefit sharing per pool.

Milestone: Pooled investment and benefit sharing mechanism tested

> Our approach to implementation is a methodical test of our hypothesis using economic signals and to inform the mechanics of Pools, thus allowing the approach to be refined, evolved, or refuted

Capital is already moving from response to prevention. We are building the primitives for where it lands.

Multiple ways to invest.

Invest in River Computer - Seeking $250K - $.5M commitments

The protocol layer - claims engine and index registry that every pool runs on, as well as the 2% fee per cycle going into River Computer.

EQUITY · SAFE

Invest in a pool

Capital placed against a named index, with benefit sharing as beneficiaries agree to return a share of savings.

PROJECT CAPITAL

Concessionary and philanthropic

De-risks a new index until it has a track record. The cheapest way to open a category.

FIRST LOSS · SEED

Public budgets and risk capital

Municipal, utility and insurer money matching into pools once the index is proven.

MATCHING

$0.5–1.3T in prevention by 2030

HOW RIVER COMPUTER EARNS

Throughput	~2% of the capital that flows through pools, for verification and settlement
Registry	each new pool reuses and can license proven indices and methods
Services	index design and structuring benefit-sharing agreements

Illustration: if 1% of the low estimate ($5B a year) ran through pools, a ~2% fee is $100M a year.

We are the first match.

River Computer has capital committed to seed the first round of pools, so incoming capital matches money already at risk rather than funding a standing start.

Adjacent: Blue Forest · BlockBima and Arbol · Carlyle × Marsh · IBHS FORTIFIED. None hold the community-scale, multi-beneficiary layer, or verification people can take part in.

BCG × Temasek 2025 (needs-based, not a revenue market); CPI 2025. Pools slice and fee figures are illustrative arithmetic, not forecasts.

Lean by design. We seek to scale rather than spike.

Imagine a world, where pools enable diverse groups to be supported for upholding stewardship:
🔥 - Fire Pools mitigate burn risk
💧 - Water Pools relieve floods.
🪱 - Earth Pools regenerate soil.
💨 - Air Pools sequester carbon.

Raising $1M to prove the loop.

One-third to one-half of the target is committed or in active discussion.

RAISE	$1M · grant or rolling post-money SAFE
CAP	$5–6M post-money
RUNWAY	18 months, tied to the three milestones
USE	50% team · 20% seed for three pools · 20% infrastructure · 10% legal and contingent

TEAM

Austin Wade Smith co-founder
Five years designing attestation, crediting and governance protocols at Regen Network; author of Ecological Institutions.

Will Gardiner co-founder
Software Engineering, Geospatial and remote sensing; protocol design. Field data platforms.

Nena Jain ecosystem + operations

We are in active discussion with many advisors and beneficiaries and in the process of formalizing MOUs.
